**Report regarding experiences with the Breathing Air Activation System BL - 1001 made by the GEOMED Biomedicine Company in Hückelhoven**

The above Breathing Air Activation System has been used successfully in my practice for several months. In order to document the way it has been used and the therapeutic successes, I would like to present the following reports of three medical cases.

1.

Female patient H.G. 35 year old woman who has had Crohn's Disease since she was 18 years of age. I have been treating her for spinal column and joint complaints due to Crohn's Disease.

She has been using the Breathing Air Activation System BL - 1001 from July 1997 up to and including December 1997, apart from when the practice was closed due to holidays, and she has had treatment each weekday.

Using this treatment her symptoms have been markedly reduced. At present there is no need for Cortisone treatment. She no longer has joint discomfort.

Since January 1998 we have changed over to treating her once a week. After 4 weeks she reported that the spinal column and joint symptoms were slowly coming back. So at the moment we are again increasing the frequency of treatment.

To sum up, the patient reports that in previous years autumn had always been her "worst season." Using therapy with Breathing Air Activation System BL 1001 "she has never been in better health in autumn."

2.

Female patient E.H. 73 year old woman who for decades has had bronchial asthma with repeated inpatient hospital stays for her asthma condition. I have been treating her for chronic degenerative spinal column syndrome.

Treatment was started in September 1997 with Breathing Air Activation System BL 1001. For 8 weeks initially the system was used daily on week days and then we changed over to using it twice a week.

Using this therapy there has to date been a marked reduction in the symptoms of the spinal column complaint, and as a whole, there has been a subjective and objective improvement in mobility and a clear reduction in pain, particularly in the neck and lumbar spine. A secondary finding is that the patient reports an improvement in her lung condition. Inpatient hospital stays have not been necessary again up until now.

3.

Patient W.N. 59 year old man who has been treated for several years. Initially we implanted a cement-free total prosthetic replacement in the left hip joint. Then we did a revision operation because of paraosseous calcification and we removed the same. Then he had a deep-seated infection which finally resulted in the dismantling of the total prosthetic replacement and in the fitting of a Girdlestone hip. For a long time after the operation, he had open wound treatment with fistulation.

After using Breathing Air Activation System BL 1001 in August 1997 the dermal sinus healed up and became irritation-free within about 4 weeks with daily application of the system.

On the basis of the above examples of courses of therapy, it seems to me, on the whole, that usage of Breathing Air Activation System BL 1001 is extremely promising as a treatment for inflammatory diseases of both the locomotor system and the alimentary canal.
